#### 10. Prenatal exposure to tobacco and future nicotine dependence : population-based cohort study

---

**Citation:** British Journal of Psychiatry, 2012, vol./is. 200/3, 0007-1250  
**Author(s):** Rydell, Mina; Cnattingius, Sven; Granath, Fredrik; Magnusson, Cecilia; Galanti, Maria Rosaria

**Language:** English

**Abstract:** Record in progress Maternal smoking during pregnancy may increase the risk of nicotine dependence, especially in girls, but data are conflicting and confounding by other familiar factors cannot be ruled out. The aims of the study were to clarify the relationship between prenatal tobacco exposure and adolescent tobacco uptake and dependence in boys and girls respectively, while taking confounding factors into close consideration. The authors conducted a prospective longitudinal study, comprising 3,020 Swedish youths followed from 11 to 18 years of age. Exposure and outcome information was elicited via self-administered parental and repeated youth questionnaires. Hazard ratios (HRs), odds ratios (ORs) and corresponding 95% confidence intervals (CIs) were calculated as measures of associations. The results were, girls prenatally exposed to maternal tobacco use had a two-to threefold increased odds of experiencing a high number of withdrawal symptoms (OR = 2.83, 95% CI 1.68-4.87), craving for tobacco (OR = 2.04, 95% CI 1.28-3.32) and heavy tobacco use (five or more cigarettes or snus dips per day) (OR = 1.93, 95% CI 1.30-2.86). These associations were weaker among boys, and did not reach formal statistical significance. Associations between prenatal tobacco exposure and onset of regular tobacco use in both genders appeared to be mostly explained by parents' social position and postnatal smoking behaviour. The conclusions were, prenatal exposure to tobacco is linked to an increased risk of nicotine dependence among adolescent girls. Cites 38 references. [Journal abstract]

### 11. A qualitative investigation of smoke-free policies on hospital property

**Citation:** Canadian Medical Association Journal, 2011, vol./is. 183/18, 1488-2329

**Author(s):** Schultz, Annette S H; Finegan, Barry; Nykiforuk, Candace I J; Kvern, Margaret A

**Language:** English

**Abstract:** Record in progress Many hospitals have adopted smoke-free policies on their property. The authors examined the consequences of such policies at two Canadian tertiary acute-care hospitals. They conducted a qualitative study using ethnographic techniques over a six-month period. Participants (n = 186) shared their perspectives on and experiences with tobacco dependence and managing the use of tobacco, as well as their impressions of the smoke-free policy. They interviewed inpatients individually from eight wards (n = 82), key policymakers (n = nine) and support staff (n = 14) and held 16 focus groups with healthcare providers and ward staff (n = 81). They also reviewed ward documents relating to tobacco dependence and looked at smoking-related activities on hospital property. The results were, non-compliance with the policy and exposure to second-hand smoke were ongoing concerns. Peoples' impressions of the use of tobacco varied, including divergent opinions as to whether such use was a bad habit or an addiction. Treatment for tobacco dependence and the management of symptoms of withdrawal were offered inconsistently. Participants voiced concerns over patient safety and leaving the ward to smoke. The interpretation was, policies mandating smoke-free

hospital property have important consequences beyond non-compliance, including concerns over patient safety and disruptions to care. Without adequately available and accessible support for withdrawal from tobacco, patients will continue to face personal risk when they leave hospital property to smoke. Cites 30 references. ## 12. Elder abuse and neglect in Ireland: results from a national prevalence survey

**Citation:** Age and Ageing, 2012, vol./is. 41/1, 0002-0729

**Author(s):** Naughton, Corina; Drennan, Jonathan; Lyons, Imogen; Lafferty, Attracta; Treacy, Margaret

**Language:** English

**Abstract:** The objective of the study was to measure the 12-month prevalence of elder abuse and neglect in community-dwelling older people in Ireland and examine the risk profile of people who experienced mistreatment and that of the perpetrators. The design was a cross-sectional general population survey. The setting was community. The participants were people aged 65 years or older living in the community. Information was collected in face-to-face interviews on abuse types, socioeconomic, health, and social support characteristics of the population. Data were examined using descriptive statistics and logistic regression, odds ratios (OR) and 95% confidence intervals (95% CI) are presented. The prevalence of elder abuse and neglect was 2.2% (95% CI: 1.41-2.94) in the previous 12 months. The frequency of mistreatment type was financial 1.3%, psychological 1.2%, physical abuse 0.5%, neglect 0.3%, and sexual abuse 0.05%. In the univariate analysis lower income OR 2.39 (95% CI: 1.01 to 5.69), impaired physical health OR 3.41 (95% CI: 1.74-6.65), mental health OR 6.33 (95% CI: 3.33-12.0), and poor social support OR 4.91 (95% CI: 2.1-11.5) were associated with a higher risk of mistreatment but only social support and mental health remained independent predictors. Among perpetrators adult children (50%) were most frequently identified. Unemployment (50%) and addiction (20%) were characteristics of this group. Cites 27 references. [Journal abstract]

#### 15. Economic constraint and modes of consumption of addictive drugs

---

**Citation:** International Journal of Drug Policy, 2011, vol./is. 22/5, 0955-3959;1873-4758

**Author(s):** Lakhdar, Christian Ben; Bastianic, Tanja

**Language:** English

**Abstract:** The background of the study was to see how economic recession, or, more generally, how increased economic constraint amongst drug users may impact their behaviour regarding the mode of drug consumption. The theoretical framework is the theory of rational addiction - drug users are considered to be rational and well-informed about the way they use drugs and the consequences of using them. Surveys in the specialist literature dealing with the potential changes in the economic context of drugs users, and with the mechanisms of the bioavailability of psychoactive substance are examined in order to highlight one of the strategies drug users can implement to circumvent economic problems - namely a change in the mode of administration. An examination of ethnographic studies and French data are also used to test the authors assumptions. Changes in the mode of drug consumption can be the result of a maximisation behaviour. Injection is the most effective way to reach a maximum bioavailability of substances.

there is evidence in favour of the hypothesis that in times of economic recession, when the economic resources of drug users can decrease, they may prefer injection to other modes of administration in order to maximise the effect of what they have purchased. The conclusion was, in times of economic recession, harm reduction policy has to be reinforced as injection behaviour can increase. As a result, economic and social policies should be an integral consideration for health policy issues. [Journal abstract]

#### 17. Drug Misuse: prevalence and service provision

---

**Citation:** , 1985

**Corporate/Institutional Author:** DEPARTMENT OF HEALTH AND SOCIAL SECURITY

**Language:** English

**Abstract:** In 1982 the Advisory Council on the Misuse of Drugs in their report 'Treatment and Rehabilitation' recommended that the prime responsibility for the provision and development of services for drug misusers should remain at local level. The Government accepted this and health authorities were asked to take urgent action to tackle the growing problem of drug abuse in DHSS circular HC (84)14 / LAC (84) 12 : (a) by assessing the extent of the problem, (b) by sending an interim report to the Department of Health and Social Security by 22 December 1984 on the scale of the problem and their plans to tackle it and (c) by including fully developed proposals in their short-term programmes for 1985-87 and in their strategic plans for 1985-94. This report contains a summary of the information obtained by health authorities and of their plans for service improvement. Section two of the report contains a general overview of the national picture. Section three contains summaries by Region. Detailed lists of various treatment and rehabilitation facilities are included in the appendices.

### 20. Vulnerable young people: making the difference

**Citation:** , 2005

<b>Corporate/Institutional Author:</b>	Home Office; Department of Health; Department for Education and Skills
<b>Language:</b>	English
<b>Abstract:</b>	This booklet is aimed at people who work in education, the voluntary sector and public services and who are involved with helping vulnerable young people. It is produced by the FRANK campaign, a Government-funded discreet and confidential service specifically dealing with drug-related issues amongst young people. The report outlines FRANK's aims and objectives and explains where its key priorities lie for drug-related problems. The report describes how to recognise the most vulnerable young people, how to identify the evidence of drug-taking and what action to take. The report includes separate sections on young offenders, truants and the socially excluded, 'looked after' children, sexually -exploited children, young homeless people, refugees and the children of drug-takers. It offers advice on how to engage with young people at risk and includes a set of information sheets with advice for group exercises and activities.

#### 25. Prevalence of HIV and hepatitis infections in the United Kingdom : annual report of the Unlinked Anonymous Prevalence Monitoring Programme 2001

---

**Citation:** , 2002

**Author(s):** O'Mahony, M

**Corporate/Institutional Author:** Unlinked Anonymous Surveys Steering Group; University of London. Institute of Child Health; Scottish Centre for Infection and Environmental Health; Public Health Laboratory Service; Department of Health

**Language:** English

**Abstract:** The report presents data on the prevalence of HIV and hepatitis infections in the UK to the end of 2001 from the Unlinked Anonymous Prevalence Monitoring Programme. It includes information on relevant markers of HIV and hepatitis prevalence, HIV incidence, risk behaviour and healthcare utilisation. Prevention indicators, which are monitored over time, are produced from the data. At the end of 2001 the number of adults living with HIV in the UK rose to an estimated 41,200, of whom around 30% were unaware of their infection. The uptake of voluntary confidential testing improved in all genitourinary medical (GUM) clinic attendee groups but a significant number of HIV-infected attendees remained undiagnosed. The detection of HIV infection in pregnant women improved significantly in 2001. In heterosexuals attending GUM clinics the prevalence of HIV in those born abroad was dramatically higher. Good practice recommendations for PCT Commissioners are summarised. Cites 31 references.

## 28. Children's needs: parenting capacity: the impact of parental mental illness, problem alcohol and drug use, and domestic violence on children's development

---

<b>Citation:</b>	, 1999
<b>Author(s):</b>	Cleaver, H; Unell, I; Aldgate, J
<b>Corporate/Institutional Author:</b>	Department of Health
<b>Language:</b>	English
<b>Abstract:</b>	This report commissioned by the Department of Health aims to scrutinise the Department's child protection studies and other relevant works to determine how parental mental illness, problem drinking, drug misuse or domestic violence affects the parent's capacity to respond to their children's needs. The report begins by looking at whether concern is justified and explores problems of terminology and prevalence. The ways in which mental illness, problem drug and alcohol use and domestic violence affect parents is then explored and the children who are most at risk are identified. The report then discusses the impact of these parental problems on child development. Six stages of childhood as used in the 'Looking after Children' materials are examined and within each stage seven developmental dimensions covering health, education, identity, family and social relationships, social presentation, emotional and behavioural development and self care skills are explored. Finally, the implications of the report's findings for policy and practice are discussed. Cites numerous references.

### 31. Report of an independent review of drug treatment services in England

**Citation:** , 1996

**Author(s):** Polkinghorne, John

**Corporate/Institutional Author:** Department of Health. Task Force to Review Services for Drug Misusers

**Language:** English

**Abstract:** The task force was asked to survey the clinical, operational and cost-effectiveness of existing drug misuse services; to examine current policy regarding users achieving a drug-free state, and reducing harm caused to and by drug misusers; and to make recommendations. It was found that treatment was effective in reducing the harm done by drug misusers. Efforts should be made to make contact with drug misusers not in touch with drug services, and to use such contacts to influence behaviour. The individual needs of drug misusers must be recognised, and purchasers must have access to a range of quality services in order to offer appropriate treatment. Service purchasers and providers must recognise that some clients will need several attempts at treatment. Research commissioned by the task force has started to examine the effectiveness of treatment approaches; this should continue. Recommendations are made for improvements to the effectiveness of drug services. Cites 145 references.

**Notes:** Dr A Thorley, HP2A, Rm 434, WEL x24617 or J Dickson, HP2A, Rm 440, WEL x247; DH Storage; Bibliography : p117-126; Chairman: The Reverend Dr John Polkinghorne

### 32. Across the divide: building community partnerships to tackle drug misuse

---

**Citation:** , 1994

**Author(s):** Howard, Roger; Beadle, Penny; Maitland, Jennie

**Corporate/Institutional Author:** Roger Howard Associates; Department of Health

**Language:** English

**Abstract:** Health organisation and community care reforms, the increase in drug misuse and other factors have resulted in the need for change in collaborative arrangements for tackling drug misuse. This report was commissioned by the Department of health, as a means of identifying good practice, and as a basis upon which to issue new guidance on interagency collaboration in this area. It is arranged in four sections : (i) pressures for change; (ii) good practice in joint working; (iii) developing effective community partnerships; and (iv) conclusions and recommendations.
